UNLOCK THE BENEFITS OF VMS: LTL CARRIERS BOOST EFFICIENCY AND CASH FLOW

Discover how CompleteView VMS from Salient Systems, an open platform video management system can be used to manage safety and security operations as well as optimize freight services.

Seeking to streamline the logistics industry, Less-than-truckload (LTL) carriers offer an innovative and agile freight service, enabling them to transport goods for a wide range of customers rapidly and cost-effectively. With unparalleled efficiency, LTL carriers are revolutionizing the way businesses transport their goods, empowering the supply chain for a seamless and simplified process.

Ideal Shipping

Efficiently navigating the world of logistics as an LTL provider means combining packages from a variety of shippers into one customized delivery. With countless variables to consider for each truckload, from package weight to delivery location, every shipment is given the expert evaluation it needs to

determine the ideal shipping cost. Properly categorizing each package guarantees that every truckload is as effective and streamlined as can be. This process is constantly happening across multiple LTL facilities, ensuring that each package arrives at its final destination in perfect condition.

Innovation is the name of the game for LTL companies as they constantly strive for more efficiency and improved internal processes. One such tool they employ is Salient Systems' CompleteView VMS, an open platform video management system, to enhance shipping accuracy with the power of visual records. The CompleteView platform captures high-quality images of parcels during the evaluation process. These images work alongside cutting-edge systems to give a 3-D measurement of packages. Together, this dynamic process ensures that billing is precise and detects anomalies in size, classification, and weight.

The correlation of the video from CompleteView with other shipping data can prompt staff to investigate the actual contents of the box and verify that the correct product classification was applied.

“While cameras can’t see into boxes, the correlation of the video from CompleteView with other shipping data can prompt staff to investigate the actual contents of the box and verify that the correct product classification was applied,” said Sanjay Challa, chief product officer, Salient Systems. “Leveraging a VMS system in this way can assist logistics companies in capturing millions in missed revenue from hundreds of misclassified packages a day, resulting in additional ROI on a security investment, but also continued annual bottom line profits.”

CompleteView doesn't just assess package accuracy; it ensures the safety of employees. By monitoring forklift operations inside the warehouse and loading areas, CompleteView doesn't miss a beat in maintaining the safety and efficiency of operations. And it doesn't stop there - CompleteView also takes care of other things, like ensuring the presence of required safety gear and making sure drivers are safely buckled up while operating heavy equipment.

CompleteView provides peace of mind knowing that employees are safe and productive. By embracing the latest technologies and preventive measures, LTL carriers are soaring to new heights of efficiency, employee safety and customer satisfaction.
